ABSTRACT

Acetylcholinesterase inhibitors are of use for treating a variety of conditions that can benefit from stimulation of the hypothalamic-pituitary-gonadal axis such as failure of ovulation, some cases of unexplained infertility, luteal phase
5 defect, hypogonadotrophic hypogonadism, aethenozoospermia, oligozoospermia, delayed onset of puberty and cryptorchidism. Suitable acetylcholinesterase inhibitors include donepezil, rivastigmine galanthamine, lycoramine and analogs thereof.
